Final Project Abstract

The purpose of this project is to detect, analyze, and locate the source of attempted intrusions to a network. This will be accomplished using the Open Source Security Information Management - OSSIM - tool. OSSIM will be deployed on a computer that is running on the network at Villanova University, and will be left to monitor action on the network to detect intrusions. After a short monitoring period, the collected data will be compiled and analyzed to look for trends or to discover something new about the attempted intrusions into Villanova's network.
