ZABBIX Network Management Tool Evaluation

-CHETHAN MUNIRAJU

Zabbix is an open source network and application monitoring tool. It is an enterprise level network management tool that is written in the powerful programming language C. Some of the features provided by Zabbix are agent and agent-less monitoring, web monitoring, web-based interface, distributed monitoring, SLA and ITIL metrics on reporting and many more. In this project I would like to evaluate the working of the tool.
