Evaluation of the network monitoring tool Zabbix.

-Chethan Muniraju

In this project I would like to showcase the working features of the monitoring tool Zabbix on a selected network either public (like network in university) or private(small personal network of 4 or more hosts).

Some of the majors tasks involved in this project are:

1. Monitoring the performance of the selected network using Zabbix and showcasing its features.

2. Implement pro-active monitoring using Zabbix.

3. Reporting of the analyzed network using Zabbix.

This project will also showcase the special features of the tool Zabbix and help in better analyzing and understanding of the network and the concepts involved in its working.

No tool is perfect. I would also like to list out the advantages and drawbacks of the tool and demonstrate the same.
