Introduction to Algorithms and Data Structures
CSC 1051 – Algorithms and Data Structures I
Dr. Mary-Angela Papalaskari
Department of Computing Sciences
Villanova University

Course website:
www.csc.villanova.edu/~map/1051/

What is this course about?

• Computer Science
• Problem solving
• Algorithmic thinking
• Data representation
• Object oriented programming using Java

Course website
www.csc.villanova.edu/~map/1051/

Links to:
• Schedule – topics, slides, projects, labs, code, etc.
• Syllabus – course information
• Piazza – class discussions, announcements
• Blackboard – submit projects, check grades
• Peer Tutors – extra help available for this course
• Exam archive – past exams and quizzes & solutions

Our textbook
Java Software Solutions
John Lewis & William Loftus
9th Edition
On reserve at the library

Older Editions: (generally ok, except for graphics sections and some exercise numbers that may be different)
An old quote

A priest asked: “What is Fate, Master?”
And he answered:
“It is that which gives a beast of burden its reason for existence. It is that which men in former times had to bear upon their backs. It is that which has caused nations to build byways from City to City upon which carts and coaches pass, and alongside which inns have come to be built to stave off Hunger, Thirst and Weariness.”
“And that is Fate?” said the priest.
“Fate... I thought you said Freight,” responded the Master.
“That's all right,” said the priest. “I wanted to know what Freight was too.”

- Kehlog Albran

Source unknown. This quote appeared as one of the “fortunes” displayed by the fortune cookie program on old unix systems. (“fortune” was a program that ran automatically every time you logged out of a unix session and displayed a random, pithy saying.)

---

Java and other high-level programming languages

- Programmer writes Source code
- Translation produces Machine code (binary code suitable to run on the computer)
- Translation is performed by an assembler, compiler, or interpreter (stay tuned)

---

Java Program Structure

- In the Java programming language:
  – A program is made up of one or more classes
  – A class contains one or more methods
  – A method contains program statements
- These terms will be explored in detail throughout the course
- A Java application always contains a method called main
- See Lincoln.java

---

Java Program Example

```java
//********************************************************************
//  Lincoln.java       Author: Lewis/Loftus
//  Demonstrates the basic structure of a Java application.
//********************************************************************
public class Lincoln
{
  // Prints a presidential quote.
  public static void main (String[] args)
  {
    System.out.println ("A quote by Abraham Lincoln:");
    System.out.println ("Whatever you are, be a good one.");
  }
}
```
Java Program Structure

// comments about the class
public class MyProgram {
    // comments about the method
    public static void main (String[] args) {
    }
}

Comments

• Comments in a program are called *inline documentation*
• They should be included to explain the purpose of the program and describe processing steps
• They do not affect how a program works
• Alternative ways of making Java comments:
  // This comment runs to the end of the line
  /* This comment runs to the terminating symbol, even across line breaks */

White Space (Spaces, blank lines, and tabs)

• Extra white space is ignored
• Programs should be formatted to enhance readability, using consistent indentation
• See Lincoln2.java, Lincoln3.java
Development Environments

- There are many programs that support the development of Java software, including:
  - Sun Java Development Kit (JDK)
  - Sun NetBeans
  - IBM Eclipse
  - IntelliJ IDEA
  - Oracle JDeveloper
  - BlueJ
  - jGRASP

- Though the details of these environments differ, the basic compilation and execution process is essentially the same.

Java Translation

- Java source code
- Java bytecode
- Bytecode compiler
- Bytecode interpreter
- Machine code

Basic Program Development

- Edit and save program
- Compile program
- Execute program
- Evaluate results

Errors

- SEPTA
Errors

- A program can have three types of errors
  - The compiler will find syntax errors and other basic problems (compile-time errors)
    - If compile-time errors exist, an executable version of the program is not created
  - A problem can occur during program execution, such as trying to divide by zero, which causes a program to terminate abnormally (run-time errors)
  - A program may run, but produce incorrect results, perhaps using an incorrect formula (logical errors)

Lab 1:

- Learn about jGrasp - the programming environment (IDE) that we will be using
- Compile and run a java program
- Understand the relationship between a Java class name and file names
- Practice using basic Java output statements and adding comments
- Learn the basics of sequential execution, variables, and the assignment statement
  
  ```java
  System.out.println("Howdy " + name);
  System.out.println(\"The answer is \" + x);
  System.out.print("Counting... up: " + (count + 1));
  System.out.println("... and\n... down: " + (count - 1));
  ``
- Experience some errors!

Identifiers

- Identifiers are used for naming variables, classes, and other components of a program.
- An identifier can be made up of:
  - letters (upper or lower case – case sensitive!)
  - digits (but cannot begin with a digit)
  - underscore character ( underscore character ( _ )
  - the dollar sign ($)
  - NOTHING ELSE!
- Example: Total, total, and TOTAL are different identifiers
- Conventions: use case to indicate whether it is a class or a variable etc.
Reserved Words
These identifiers have a special meaning in Java and cannot be used in any other way:

- abstract
- assert
- boolean
- break
- byte
- case
- catch
- char
- class
- const
- continue
- default
- do
- double
- else
- enum
- extends
- false
- final
- float
- for
- goto
- if
- implements
- import
- instanceof
- int
- interface
- new
- null
- package
- private
- protected
- public
- return
- short
- static
- strictfp
- super
- switch
- synchronized
- this
- throw
- throws
- transient
- true
- try
- void
- while

Character Strings
- A string literal is represented by putting double quotes around the text
- Examples:
  - "This is a string literal."
  - "123 Main Street"
  - "X"

The println Method
- In the Lincoln program we invoked the println method to print a character string
- The System.out object represents a destination (the monitor screen) to which we can send output

```java
System.out.println("Whatever you are, be a good one.");
```

The print Method
- In the Lincoln program we invoked the print method to print a character string
- The System.out object represents a destination (the monitor screen) to which we can send output
- print is similar to println except that it does not advance to the next line

```java
System.out.print("Whatever you are, be a good one.");
```
String Concatenation

- The *string concatenation operator (+)* is used to append one string to the end of another
  
  "And one more " + "thing"

Hands on:

- Use MyQuote.java as a starting point (program from Lab 1), focus on this part of the code:

  ```java
  System.out.println("Howdy " + name);
  System.out.println("The answer is " + x);
  System.out.print("Counting... up: " + (count + 1));
  System.out.println("... and down: " + (count - 1));
  ```

- Try the following:
  1) What if you remove the parentheses around `(count + 1)`?
  2) What happens if we try this way of breaking a line:
     ```java
     System.out.print("Counting... up: " + (count + 1));
     ```
  3) How can we get all this output to print all in one line?

- Other examples (textbook): Countdown.java Facts.java

Escape Sequences

- What if we wanted to print the quote character? e.g.,
  ```java
  System.out.println("I said "Hello" to you."); // wrong!
  ```

- An escape sequence is a series of characters that represents a special character.

- Example:
  ```java
  System.out.println("I said "Hello" to you.");
  ```

- Some Java escape sequences:

<table>
<thead>
<tr>
<th>Escape Sequence</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\t</td>
<td>tab</td>
</tr>
<tr>
<td>\n</td>
<td>newline</td>
</tr>
<tr>
<td>&quot;</td>
<td>double quote</td>
</tr>
<tr>
<td>'</td>
<td>single quote</td>
</tr>
<tr>
<td>\</td>
<td>backlash</td>
</tr>
</tbody>
</table>

Example from textbook: Roses.java

```java
//********************************************************************
// Roses.java  Author: Lewis/Loftus
// Demonstrates the use of escape sequences.
//********************************************************************
public class Roses
{
  //------------------------------------------------------------------
  // Prints a poem (of sorts) on multiple lines.
  //------------------------------------------------------------------
  public static void main (String[] args)
  {
    System.out.println("Roses are red,\nViolets are blue,\nSugar is sweet,\nBut I have "commitment issues",\nSo I'd rather just be friends\nAt this point in our relationship.");
  }
}
```
Quick Check

Write a single `println` statement that produces the following output:

"Thank you all for coming to my home tonight," he said mysteriously.

Context:
Reverse History of computing

Examine what we already know, travel backwards…

1. What we see now all around us – a connected world of computing
2. Focus on a single “traditional” computer
3. Dig deeper – data and processing

Computer Networks

- A network is two or more computers that are connected so that data and resources can be shared
  - Local Area Network (LAN) / Wide Area Network (WAN)
- The Internet is a WAN which spans the planet
  - The Internet Protocol (IP) determines how data are routed
  - Devices have unique IP addresses, e.g., 204.192.116.2
- The World Wide Web provides a common interface to internet data:
  - Text, graphics, video, sound, audio, executable programs
  - Web documents often use HyperText Markup Language (HTML)
  - Uses Uniform Resource Locator (URL), e.g.: http://www.whitehouse.gov/issues/education
- A browser accesses network resources
  - Popular browsers: Chrome, Internet Explorer, Safari, Firefox
  - My first browser: Mosaic <3

Historical Note: Connecting the world

The Internet

History: Started as a United States government project, sponsored by the Advanced Research Projects Agency (ARPA) in late 1960’s

See also: http://www.internethalloffame.org/internet-history/timeline

- 1970’s and 1980’s: **ARPANET**
  - wide area network
  - protocols for communication
- 1990’s: **World Wide Web**
  - html and web browsers
Introduction

CSC 1051 Villanova University

Dr. Papalaskari

The Arpanet in 1971

‘Interface Message Processor’ (IMP) evolved into today’s routers.

Historical Note: Connecting the world

The Arpanet in 1971

Reverse History of computing

2. Focus on a single “traditional” computer

3. Dig deeper – data and processing

A Computer Specification

• Consider the following specification for a personal computer:
  – 3.07 GHz Intel Core i7 processor
  – 4 GB RAM
  – 750 GB Hard Disk
  – 16x Blu-ray / HD DVD-ROM & 16x DVD+R DVD Burner
  – 17” Flat Screen Video Display with 1280 x 1024 resolution
  – Network Card

Computer Architecture
Memory

- Memory locations (or cells) identified by a unique numeric address. Memory = Main Memory = Random Access Memory (DRAM or RAM) - because you don’t have to scan the memory sequentially – go to data directly using the address.

CPU and Main Memory

- Historical note: Von Neumann architecture
- John Von Neuman, USA 1945
- Chip that executes program commands.

The Central Processing Unit

- A CPU is on a chip called a microprocessor.
- It continuously follows the fetch-decode-execute cycle:

  - System clock: controls speed, measured in gigahertz (GHz)
A machine that can follow a series of steps - a "program"

- Early efforts:
  - Jacquard loom (France 1801)
  - Babbage's Difference engine and Analytical engine (England 1822)
  - Holerith's census machine (USA 1890)
- Colossus Mark I - first electronic computer to be programmable (Alan Turing, England 1944)
- Stored program and the fetch/decode/execute cycle (John von Neumann, USA 1945)
- ENIAC - first fully electronic digital computer (Eckert and Mauchley, University of Pennsylvania, 1946)

**Historical Note:** Automatic control of computation

**Jacquard Loom**

This portrait of Jacquard was woven in silk on a Jacquard loom using 24,000 punched cards (1839).

Charles Babbage owned one of these portraits; it inspired him in using punched cards in his analytical engine.

(Source: Wikipedia)

**Charles Babbage & Ada Lovelace**

Designed the Analytical Engine

First “Programmer” for (not yet built) Analytical Engine

**Historical Note:** Automatic control of computation

**1945: The word “computer” changes its meaning**

Captain Grace Hopper and other computers

The Electronic Numeric Integrator and Calculator (ENIAC)

Programmers Betty Jean Jennings (left) and Fran Bilas (right) operate ENIAC’s main control panel at the Moore School of Electrical Engineering.

2. Focus on a single “traditional” computer

3. Dig deeper – data and processing

Data Representation

• Computers store all information **digitally**, using **binary** codes:
  - numbers
  - text
  - images
  - audio
  - video
  - program instructions

A **byte** is a group of eight bits

• a number?
• a letter?
• the red component of a pixel?
• a program instruction?

Computing devices store use binary codes to represent data of **all kinds**
Example: Representing Text

- Characters, including spaces, digits, and punctuation are represented by numeric codes

```
Hi, Heather.
```

```
72  105  44  32  101  97  116  104  101  114  46
```

The ASCII (American Standard Code for Information Interchange) character set uses eight bits per character, allowing for 256 unique characters.

The Unicode character set extends ASCII to sixteen bits per character, allowing for 65,536 unique characters.

Example: Representing Pixels

```
Color(116, 86, 142)
```

```
red=116  green=86  blue=142
```

Example: Representing Program Instructions

Intel opcode for the instruction JZ (jump if zero):

```
01110100
```

Historical Note:
Symbolic Representation & Mechanization of Arithmetic

- Development of number systems & geometry
- The notion of an algorithm
- Creation of special purpose calculators
**Historical Note:**

Dr. Papalaskari
Introduction

**Historical Note:**
Symbolic Representation & Mechanization of Arithmetic

- Creation of special purpose calculators
  - Stonehenge (1900-1600 BC)
  - Pascal's adder (1642)
  - Leibniz's calculator (1670s)

- 1975 Texas Instruments calculator

**Welcome to Computer Science!**
A new paradigm in humanity’s search for understanding of:
- Symbolic representation
- Computation
- Problem solving
- Mechanization

**History Epilogue:** Just like Physics and other sciences branched off from philosophy during the Renaissance, so CS emerged in the 20th century from the work of philosophers and mathematicians – with the help of dedicated, visionary practitioners, experimental scientists and engineers.

**Summary**
- An introduction to Java:
  - Identifiers
  - Comments
  - Errors
  - Strings and printing
- History of computing
- Computer hardware and software overview

**Historical notes:**
Trends that gave rise to the modern computer

- **Symbolic representation and the mechanization of arithmetic** – the concepts of numbers, symbols, algorithms, and computation
- **Automatic control of computation** – a “program” to control operations (fetch/decode/execute cycle and the stored program concept)
- **Connecting the world** – networks and telecommunications

= modern computer
