Quiz 2 1/31/19

1. What gets printed by the following code fragment?

```java
int num1 = 4; int num2 = 3;
if (num1 + num2 < 9)
{
    System.out.println("red");
    System.out.println("orange");
}
else
    System.out.println("white");
if (num1 >= num2)
    System.out.println("beige");
else
    if ((num1 + 10) >= num2)
    {
        System.out.println("black");
        System.out.println("blue");
    }
    else
        System.out.print("yellow");
System.out.println("green");
```

2. The following code is supposed to compute and print the maximum of three variables a, b, c, but it does not work. Provide an example of values of a, b, c for which it gives the wrong answer and show how to correct it by making a couple of small changes (i.e., do NOT rewrite all of it).

```java
if (a > b)
    if (b > c)
        max = a;
    else
        max = c;
else
    if (b > a)
        max = b;
    else
        max = c;
System.out.println("max = " + max);
```
Quiz 2 1/31/19

1. What gets printed by the following code fragment?

```java
int num1 = 5; int num2 = 16;
if (num1 + num2 < 9)
{
    System.out.println("green");
    System.out.println("red");
}
else
    System.out.println("white");
if (num1 >= num2)
    System.out.println("beige");
else
    if ((num1 + 10) >= num2)
    {
        System.out.println("black");
        System.out.println("blue");
    }
    else
        System.out.println("yellow");
System.out.println("brown");
```

2. The following code is supposed to compute and print the minimum of three variables a,b,c, but it is incomplete. Finish it by filling in the missing code.

```java
if (a < b)
    if (a < c)
        min =
    else
        min =
else
    if

System.out.println("min = " + min);
```
